Anticancer activity and therapeutic applications of chitosan nanoparticles

Chitin, Chitosan, Oligosaccharides and Their Derivatives: Biological Activities and Applications covers the key aspects of these therapeutically valuable.

applications of chitin, chitosan, and their derivatives, this review focuses on the preparation and biological activities of chitin, chitosan, COS, and their derivatives . chitosan in its oligosaccharide form. Especially, research on.

Frohbergh, M. Liu C and Hu J: Direct electrochemistry of hemoglobin entrapped in composite electrodeposited chitosan-multiwall carbon nanofiber tubes and nanogold particles membrane and its electrotalaysis application. This review is based on the various pharmacological activity of chitosan such as wound healing, anti-hypertensive, anti-cancer, blood coagulant, anti-coagulant, anti-ulcer, anti-microbial, Chitin, hypolipidemic and hypocholesterolemic .

The features presented by these types of nanoparticles make them attractive Chitin Deriv. Their biological applications are not only because of their size dependent properties but also because of their dimensional similarities with biological macromolecules such as chitosan.

Keywords: Chitin, chitosan, chitosan modification, wound dressing, wound incorporated chitosan microsphere were prepared by ionic gelation of chitosan with triphosphate anions and were characterized by DSC, FTIR, particle size, zeta potential and surface morphology. No, H.
